Experience

Senior Software Engineer, 7AI – Boston, MA

Sept 2025 – Sept 2026

- Owned the 7QL programming language, a multiplexing query transpiler for allowing AI agents to use a single query language to fan out across dozens of target datastore languages
- Scaffolded the 7AI SIEM, a fully modular, polylingual storage system written in Rust that allows users to provide their own storage backends to minimize cost and barriers to entry for migration
- Delivered agentic federated search, an agent-driven chat tool for interactive exploration of customer data that fed into automated alert detections
- Led a pilot program for open-source coding models (GLM at Cloudflare and Baseten), projecting \$1M+ in annual savings for agentic coding
- Onboarded and instructed engineers and non-engineers about agentic development and cost reduction while maintaining feature quality

Software Development Engineer II, Flexport – Seattle, WA

July 2023 – Aug 2025

- Created Duty Drawback ("import tax returns") service with React frontend + Rust backend in startup-style team
- Reduced latency from 8 hrs to 3 mins with algorithmically-efficient approach for 80% of company's client claims
- Improved drawback claim totals by 15-30% for various provisions, earning \$1M+ extra commission for single claim
- Developed new Kotlin event processing service for recording historic costs for use in future pricing estimation

Software Development Engineer I, Amazon Web Services – Seattle, WA

Jan 2022 – June 2023

- Contributed to AWS Lambda's SnapStart, a feature to reduce cold-start time for serverless invokes
- Developed FuseFS, a Rust-based FUSE/UFFD filesystem, along with TypeScript/Kotlin/Go microservices
- Architected full CD, continuous end-to-end canary latency testing system for full AWS Lambda invoke stack
- Improved P99 cold start invoke latency by 20% by proactively fetching more data for all Lambda functions
- Mentored team members and others on best practices of programming in Rust; mentored junior devs broadly

Research and Development Engineer, ABB – Atlanta, GA

Mar 2020 – Dec 2021

- Prototyped and developed the Common Data Layer, a backend-agnostic storage system in Rust
- Wrote proposals as RFC's, moderated discussion, and implemented proposed features into services
- Improved throughput of internal storage system more than 20 fold by transitioning to parallel/async behavior

Full-Stack Developer, NCR – Atlanta, GA

July 2019 – Mar 2020

- Reworked over half of a 3 team codebase in 1.5 months to add unified state management to frontend

Education

Georgia Institute of Technology, Master of Science in Computer Science – Atlanta, GA

Dec 2023

Georgia Institute of Technology, Bachelor of Science in Computer Science – Atlanta, GA

May 2019

- Graduated with Highest Honors

Skills

Programming Languages: Rust, Python, TypeScript, Kotlin, Go, Java, Zig, C, HTML/CSS

Communication Protocols: REST, GraphQL, protobuf, gRPC, Kafka, Kinesis, SQS, WebSockets

Development Tooling: Kubernetes, Docker, Git, Jira

Frameworks: React, Svelte, Angular, Axum, Actix Web, Warp

Projects

Roc

- Maintainer for the upcoming Roc functional-but-friendly language focused on safety, runtime + compilation speed
- Orchestrated rewrite of Roc language core from Rust to Zig to coordinate parallel development of compiler stages

smoresboards

- Designed and sold 50+ sub-40% ergonomic keyboards to reduce typing strain
